Global Attractors of Non-autonomous Difference Equations

David Cheban, Cristiana Mammana, Elisabetta Michetti

Abstract

The article is devoted to the study of global attractors of quasi-linear non-autonomous difference equations, in particular we give the conditions for the existence of a compact global attractor. The obtained results are applied to the study of a triangular economic growth model $T : \mathbb{R}_+^2 \rightarrow \mathbb{R}_+^2$ recently developed in Brianzoni S., Mammana C. and Michetti E. [1].
